CXC receptor 4 agonists that reduces hematopoietic and susceptibility to cytotoxic agents, are useful peripheral blood stem cell transplantation. cell multiplication for bone marrow or

Example 1; Page 42; 74pp; English.

The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoietic cell multiplication. These peptides act as CXC chemokine receptor 4

The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoletic cell multiplication. These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematoric cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic
                                                                                                                                                                                                                                                                                                                            Salari H,
Cashman J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                     CXC receptor 4 agonists that reduces hematopoietic and susceptibility to cytotoxic agents, are useful peripheral blood stem cell transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                               12-APR-2000; 2000CA-02305036.

                                                                                                                                                                                                                                                        The present sequence is a synthetic chemokine peptide of the chemokine stromal cell-derived factor-1 (SDF-1). It is useful for inhibiting the entry of Human immunodeficiency virus-1 (HIV-1) into CXC chemokine receptor 4 (CXCR4)-expressing cells and for treating HIV infection. The novel SDF-1 derived synthetic peptides have enhanced activity over separate peptides derived only from the N-terminal segment of SDF-1 or derived only from the X-terminal segment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               agent, particularly in a patient with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, an autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel synthetic chemokine peptides of stromal cell derived for inhibiting HIV-1 entry and infection via CXC chemokine and in HIV infection treatment and prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chemokine-derived synthetic peptide; anti-HIV; stromal cell-derived factor-1; SDF-1; Human im
                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 30

                                                                                                                                                                                                                                                                                                                                              The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoietic cell multiplication. These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the calls prior to reduce susceptibility of the cytotoxic agent. The CXCR4 agonist
                                                                                                                                                                                                                                                                                                         is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CXC receptor 4 agonists that reduces hematopoietic cell multiplication and susceptibility to cytotoxic agents, are useful for bone marrow or peripheral blood stem cell transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Haematopoietic cell; multiplication; CXC chemokine receptor 4; CXCR4; agonist; etromal cell derived factor one; SDF-1; autoimmune disease; macrophage inflammatory protein 1-alpha; MIP-1-alpha; cancer; autologallogenic; bone marrow; stem cell; transplantation.

CXC receptor 4 agonists that reduces hematopoietic and susceptibility to cytotoxic agents, are useful peripheral blood stem cell transplantation. cell multiplication for bone marrow or

Claim 8; Page 58; 74pp; English.

The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoietic cell multiplication. These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or alloganic bone marrow or peripheral blood stem cell transplantation, or autoimmune disease

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIF-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or allogonic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Salari F

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDP-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cCXCR4 agonist or during exposure of the cells to the cytotoxic agent, particularly in a pattent with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                             Haematopoietic cell; multiplication; CXC chemokine receptor 4; CXCR4; agonist; stromal cell derived factor one; SDF-1; autoimmune disease; macrophage inflammatory protein 1-alpha; MIP-1-alpha; cancer; autologiallogenic; bone marrow; stem cell; transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CXC receptor 4 agonists that reduces hematopoietic cell multiplication and susceptibility to cytotoxic agents, are useful for bone marrow or peripheral blood stem cell transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         12-APR-2000; 2000CA-02305036

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. Particularly in a patient with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12-APR-2000; 2000CA-02305036.

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytocoxic agent, by administering one of the agonist peptides to the cells prior to or ducing exposure of the cells to the cytocoxic agent, particularly in a patient with cancer requiring autologous or allogenic bor marrow or peripheral blood stem cell transplantation, or an autologenic marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12-APR-2000;

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent, particularly in a patient with cancer requiring autologous or alloganic bone marrow or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  12-APR-2000; 2000CA-02305036.

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDP-1) with some also containing sequences derived from macrophage inflammatory protein 1-labpa (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or an approximate diagram. Or peripheral blood stem cell transplantation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-APR-2000;

These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent. The CXCR4 agonist is used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, particularly in a patient with cancer requiring autologous or allogenic bone marrow or peripheral blood stem cell transplantation, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoletic cell multiplication. These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoletic cells to a cytoroxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytoroxic agent, particularly in a patient with cancer requiring autologous or allogenic bore marrow or peripheral blood stem cell transplantation, or an autoformume disease.
                                                                                                                                                                                                     12-APR-2001; 2001WO-CA000540
                                                                                                                                                                                                                                                 18-OCT-2001.

The sequences given in AAB47680-717 represent peptides which may be used in the method of the invention for reducing the rate of hematopoietic cell multiplication. These peptides act as CXC chemokine receptor 4 (CXCR4) agonists to the cells. These peptides are based on stromal cell derived factor one (SDF-1) with some also containing sequences derived from macrophage inflammatory protein 1-alpha (MIP-1-alpha). They can be used to reduce susceptibility of hematopoietic cells to a cytotoxic agent, by administering one of the agonist peptides to the cells prior to or during exposure of the cells to the cytotoxic agent, particularly in a patient with cancer requiring autologous or allogenic been marrow or peripheral blood stem cell transplantation, or

APPLICANT:

APPLICANT: APPLICANT:

Saxena, Geeta Eaves, Connie J. Merzouk, Ahmed Arab, Lakhdar

APPLICANT: Tudan,

Christopher R.

```
CURRENT FILING DATE: 2001-08-20

FRIOR APPLICATION NUMBER: CA 2,305,036

PRIOR APPLICATION NUMBER: CA 2,305,036

PRIOR APPLICATION NUMBER: US 60/232,425

PRIOR APPLICATION NUMBER: US 60/232,425

PRIOR FILING DATE: 2000-09-14

PRIOR APPLICATION NUMBER: CA 2,335,109

PRIOR FILING DATE: 2001-02-23

NUMBER OF SEQ ID NOS: 34

SOPTWARE: PATENTARE: Artificial Sequence

SEQ ID NO 12

LENGTH: 30

TYPE: PAT

ORGANISM: Artificial Sequence

PERIURE:
NAME/KEY: DOMAIN

LOCATION: (15)..(17)

LOCATION: (15)..(17)

COTHER INFORMATION: G's) may be used in variable numbers, such as 2, 3

OTHER INFORMATION: Synthesised in Laboratory:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    APPLICANT: Cashman, Johanne

TITLE OF INVENTION: CXCR4 AGONIST TREATMENT OF HEMATOPOIETIC CELLS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   APPLICANT:
                                                                                                                                                                                                                                                                                                                                NAME/KEY: DOMAIN
LOCATION: (20)..(24)
LOCATION: (20)..(24)
OTHER INFORMATION: Cyclized, for example glutamate (E) and lysine (K)
OTHER INFORMATION: residues may be joined by side chain cyclization
OTHER INFORMATION: using a lactam formation.
OTHER INFORMATION: Synthesised in Laboratory:
OTHER INFORMATION: SDF-1(1-14)-(G)4-SDF-1(55-67)-K20/E24-cyclic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                NAME/KEY: DOMAIN
LOCATION: (15)..(18)
LOCATION: (15)..(18)
OTHER INFORMATION: spacer monomers (such as the illustrated glycine
OTHER INFORMATION: G's) may be used in variable numbers, such as 2,
OTHER INFORMATION: or 4 glycines.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                      PTM: Processed forms SDF-1beta(3-72) and SDF-1alpha(3-67) are produced after secretion by proteolytic cleavage of isoforms Beta and Alpha, respectively. The N-terminus processing is probably achieved by DPP4. Isoform Alpha is first cleaved at the C-terminus to yield a SDF-1-alpha(1-67) intermediate before being processed at the N-terminus. The C-terminal processing of isoform Alpha is
